

AMEX-10 VARIO

THE PERFECT SYSTEM FOR REPAIRING RADIAL CRACKS, LEAKS
OR DEFECTIVE COATINGS IN PIPELINES - EXCLUSIVELY FROM PMP

The problem of repairing radial cracks in pressurised and non-pressurised pipelines has presented challenges to Utilities Engineers for many years. Now PMP is able to offer a cost effective 'No Dig' solution to this problem. The system can be installed in any pipeline where man access can be gained.

The system offers the following benefits:

- Flexible and fast installation
- Any length of installation can be achieved
- Complete protection against aggressive liquids
- Ideal for diameters where other liner systems are not suitable
- Protects against failed coatings or linings such as cement, bitumen or epoxy

The AMEX-10 VARIO Seal is designed for repair applications where leaks in pipes run diagonally or horizontally along the pipe and where hot or UV cured liner systems are not suitable. Unlike Cured In Place Lining systems, a degree of flow through the pipe can be maintained during installation, negating the need for over pumping.

Based on the same principles as the AMEX-10 MONO Seal, many AMEX-10 VARIO Seals can be linked together to form a continuous chain to span any crack, leak or defect in a lined or unlined pipe where man access can be gained. A perfect seal is achieved between each section of AMEX-10 VARIO due to its 'tongue and groove' joint design.

The same stainless steel retaining rings used in the original AMEX-10 MONO Seal are used to secure the AMEX-10 VARIO into place.

The AMEX-10 VARIO can be used in both pressurised and non-pressurised pipelines and is suitable for potable water, waste water and sewerage pipelines. It can also be used in pipelines carrying aggressive liquids, and in gas pipelines. Like the rest of the AMEX-10 Seal range it carries a 50 year life expectancy and PMP's exclusive 'No Seal, No Pay' guarantee.
